Portfolio Website Guide

Pulikunta Anudeep Kumar Reddy

Software Engineer Portfolio

This guide explains what the website is, how it is built, how to run it locally, and how to deploy it.

1. Purpose

This website is a recruiter-focused personal portfolio. It presents professional experience, selected engineering projects, technical skills, certifications, research publication, education, and sports achievements in a fast, server-rendered format.

2. Technology Stack

- Backend: Python with Flask
- Templates: HTML5 with Jinja2
- Styling: Plain CSS
- JavaScript: Minimal vanilla JS for mobile navigation only
- Hosting target: Vercel free tier (Python/Flask)

No React, Next.js, Tailwind, Bootstrap, databases, or contact-form backend are used.

3. Project Structure

- app.py - Flask application and routes
- content.py - Profile, experience, projects, skills, certifications, and other content
- templates/ - Shared layout, homepage, project pages, and partials
- public/css/style.css - Design system and layout styles
- public/js/main.js - Mobile menu accessibility helpers
- public/images/ - Portrait, certificate previews, achievement photos
- public/certificates/ - Downloadable certificate PDFs
- public/resume.pdf - Downloadable resume
- requirements.txt - Python dependencies
- .python-version - Python 3.12 for Vercel
- vercel.json - Function settings for deployment
- tests/test_app.py - Basic route and asset checks

4. Website Sections

- Hero - Name, headline, introduction, square portrait, and primary actions
- About - Short professional summary and focus areas
- Experience - Societe Generale and Turing roles
- Projects - Production Status Dashboard, Ganesha Festival Platform, Data Processing
- Skills - Practical technology groups used in delivery work
- Credentials - Verified certificates, publication, education, achievements
- Contact - Email and LinkedIn only (phone is intentionally not shown)

5. Important Design Choices

- Premium graphite, ivory, and champagne-gold visual system
- Square portrait framing to match the original square photo
- Project previews are HTML/CSS illustrations with synthetic data, not confidential screenshots
- Certificates with real files are shown as preview cards
- Resume-only certifications appear in a compact list
- Extra documents are collapsed under More documents on file

6. Key Routes

- / - Homepage
- /projects/<slug>/ - Project case study pages
- /resume.pdf - Resume download
- /certificates/... - Certificate PDFs
- /images/... - Public image assets
- Custom 404 page for unknown routes

7. Run Locally

From the project root:

- python3 -m venv .venv
- source .venv/bin/activate
- pip install -r requirements.txt
- python app.py
- Open http://127.0.0.1:5000

Optional tests:

- pip install pytest
- pytest -q

8. Deploy to Vercel

- Push the repository to GitHub, GitLab, or Bitbucket
- Import the project in Vercel
- Set Root Directory to the repository root where app.py lives
- Allow Vercel to detect Flask from requirements.txt
- Deploy and verify homepage, project pages, resume, CSS, and certificate links

Static files in public/ are served by Vercel CDN. Locally, Flask also serves the public folder so asset URLs work the same way in development and production.

9. Content Updates

Most text content lives in content.py. Update experience, projects, skills, certifications, and achievements there. Templates automatically render the updated content.

To update the resume, replace public/resume.pdf. To update the portrait, replace public/images/portrait/anudeep-portrait.jpg. To add a certificate, place the PDF in public/certificates/, add a preview image under public/images/certificates/, and register it in content.py.

10. Privacy and Safety

- Phone number is not displayed on the website
- No confidential production screenshots are published
- Festival demo links are omitted to protect private community records
- No contact form backend stores messages

11. Contact

Email: anudeepreddy453@gmail.com

LinkedIn: https://www.linkedin.com/in/anudeepreddy-pulikunta/

Location: Bengaluru, India

12. Note

This guide describes the Flask portfolio implementation in the repository. It is intended for local

setup, deployment, and future maintenance.
